

Program.cs

```
using Day2Task.Repo;

namespace Day2Task
{
    class Program
    {
        static void Main(string[] args)
        {
            IEmployeeRepo<Manager> employee = new EmployeeRepo<Manager>();

            Manager emp1 = new Manager(1, "Dharanesh", "Frontend", "Saravana");
            Manager emp2 = new Manager(2, "Karthi", "Backend", "Saravana");

            employee.AddEmployee(emp1);
            employee.AddEmployee(emp2);

            List<Manager> employees = employee.getAllEmployee();

            foreach (Manager emp in employees)
            {
                Console.WriteLine("Employee Details : "+emp.getEmployeeDetails());
            }

            Console.WriteLine("Get Employee By Id (2):
"+employee.getEmployeeById(2).getEmployeeDetails());

        }
    }
}
```

Employee.cs

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;

namespace Day2Task
{
    internal class Employee
```

```

{
    public Employee(int id, string Name, string Role)
    {
        this.Id = id;
        this.Name = Name;
        this.Role = Role;
    }

    public int Id { get; set; }
    public string Name { get; set; }
    public string Role { get; set; }

}
}

```

Manager.cs

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Text;
using System.Threading.Tasks;

namespace Day2Task
{
    internal class Manager : Employee
    {
        public string empManager {get; set;}

        public Manager(int Id, string Name, string Role, string Empmanager) :
            base(Id, Name, Role) {
            empManager = Empmanager;
        }

        public string getEmployeeDetails()
        {
            return $"Id : {Id} Name : {Name} Role : {Role} Manager : {empManager}";
        }
    }
}

```

EmployeeRepo.cs

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;

namespace Day2Task.Repo
{
    internal class EmployeeRepo<T> : IEmployeeRepo<T> where T : Employee
    {
        List<T> _list = new List<T>();

        public void AddEmployee(T employee)
        {
            _list.Add(employee);
        }

        public List<T> getAllEmployee()
        {
            return _list;
        }

        public T getEmployeeById(int id)
        {
            return _list.Find(emp => emp.Id == id);
        }
    }
}
```

IEmployeeRepo.cs

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;

namespace Day2Task.Repo
{
```

```
internal interface IEmployeeRepo<T>
{
    void AddEmployee(T employee);
    List<T> getAllEmployee();
    T getEmployeeById(int id);
}
}
```

Output :

```
Employee Details : Id : 1 Name : Dharanesh Role : Frontend Manager : Saravana
Employee Details : Id : 2 Name : Karthi Role : Backend Manager : Saravana
Get Employee By Id (2): Id : 2 Name : Karthi Role : Backend Manager : Saravana
```
