

1. Write a python program which defines a function to find maximum of 3 numbers. Read the numbers as input and pass as argument to the function.

Code:

```
def maximum(a, b, c):  
    return max(a,b,c)  
  
a=int(input("Enter number 1: "))  
b=int(input("Enter number 2: "))  
c=int(input("Enter number 3: "))  
  
print(f"Maximum : {maximum(a,b,c)}")
```

Output:

```
Enter number 1: 98  
Enter number 2: 67  
Enter number 3: 99  
Maximum : 99
```

2. Write a python program to read string as input and check whether it is a palindrome.

Code:

```
string = input("Enter the String : ")  
  
if(string == string[::-1]):  
    print(f"{string} is Palindrome")  
else:  
    print(f"{string} is not a Palindrome")
```

Output:

```
Enter the String : malayalam  
malayalam is Palindrome
```

3. Write a Java program which performs file copy.

Code :

```
package com.payoda.training1.ooc;  
import java.io.FileInputStream;  
import java.io.FileOutputStream;  
import java.io.IOException;
```

```

public class FileCopy {
    public static void main(String[] args) {
        String sourceFile = "sample.txt";
        String destFile = "destination.txt";
        try (FileInputStream fis = new FileInputStream(sourceFile);
            FileOutputStream fos = new FileOutputStream(destFile)) {
            byte[] buffer = new byte[1024];
            int length;
            while ((length = fis.read(buffer)) > 0) {
                fos.write(buffer, 0, length);
            }
            System.out.println("File copied successfully!");
        } catch (IOException e) {
            System.out.println("Error occurred: " + e.getMessage());
        }
    }
}

```

Output:

```

<terminated> FileCopy [Java Application] C:\Users\
File copied successfully!

```

4. Write a python program to find the number of lines, words and characters in a file.

Code:

```

with open('sample.txt','r') as f:
    rd = f.readlines()
    print(f"Line Count {len(rd)}")
    ar = []
    ar1 = []
    for i in rd:
        ar.append(i.strip())
        for j in i:
            if not j.isspace():
                ar1.append(j)
arr = ' '.join(ar)
print(f"Word Count {len(arr.split())}")
print(f"Character Count {len(ar1)}")

```

Output:

Line Count 8
Word Count 32
Character Count 120
